Continuation of 5. Applicant's reply has overcome the following rejection(s): The obviousness type double patenting rejections are overcome. The rejection of claims 4, 18, 19 and 32 under 35 USC 112, 2 para. are overcome.

Continuation of 11. does NOT place the application in condition for allowance because: With regard to the rejection of claim 32 under 112 para. 2, Applicants' argue that the use of "derived from" is acceptable and was discussed in the interview. However, no record of this discussion appears on the record, particularly on any PTOL -413. It is however understood that, in this claim, the term an oligomer "derived from" particular monomer units means that the oligomer is formed from a chain -addition reaction across the carbon-carbon double bond of those monomer units. With regard to the rejections under the prior art, these rejections are maintained because a review of the prior art, paying special attention to the monomers used and how those monomers are combined for polymerization, indicates that the oligomer composition of instant claims is in fact formed in situ during the polymerization reaction in the art. Applicant argues against this, stating that the result of the art-disclosed methods and compositions is a fully crosslinked materials with no pendant olefins. However, it is noted that the rejection is not based on the final composition of the art. On the other hand, the rejection is bas ed on the fact that the evidence combination of monomers preformed in the art will initially give the instantly claimed composition, and then continue to react to provide a product which does not read on instant claims. Nonetheless, instant claimed composition is inherently formed during the initial stages of the methods disclosed in the art.
